Third & Grove™

Taking Images to the Next Level in Drupal 8

Abby Milberg, Front-End Architect

DrupalCon Nashville 2018

Our Goal

Giving content creators greater control over images, while keeping the site **consistent**, **performant**, and **secure**.

A better time than ever to push the boundaries on Drupal images...

- Breakpoint and Responsive Image modules in core
- Media module in core

Should all images be treated the same?

Adjusting Spacing Based on Orientation

Use CSS to adjust the size of small images when you can't crop (such as with SVGs) or don't want to (such as with logos).
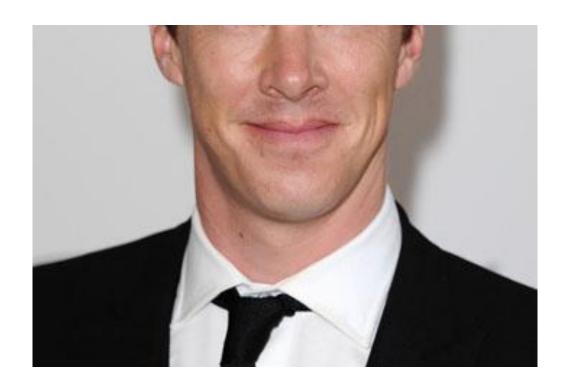

Choosing Image Styles

Let the content creator choose from two or more pre-defined image styles or responsive image styles.

Different Breakpoint, Different Image

Use two completely separate images at different breakpoints with the <picture> element, rather than just different image styles.

Crop With Care

Background Images

Set your image field as an inline background-image, using javascript to avoid loading large sizes on small viewports.

Keep it Sharp - SVGs

There's finally a stable release of a contrib module for SVG images - svg_image. (Be mindful of security.)

Thank You
